

Levels with an intrinsic lifetime inside 20 ps – 1 ns

19 fine-structure multiplets, in 5 of the 17 species scraped from NIST ASD and ExoMol LiDB.

Lifetime is $1/\Sigma A_{ki}$ summed over every known decay channel, J-resolved; the decay column is the strongest single channel.

Nothing in the window — Ar I, Ca I, Kr I, Kr II, Kr III, Kr IX, Li I, Ne I, Xe I, Xe II, Xe III, Xe IX.

Xe III, Kr III, Xe IX and Kr IX carry no A-values in ASD at all and have no LiDB entry above charge 1 — untested rather than negative.
